

【Document Name】 ABSTRACT

【Abstract】

【Subject】 Developing an optical member which hardly generates blocking and which ensures that, even if the optical members are transported or stored in stacking state and subjected to a process of automatically assembling liquid crystal displays and the like, the optical members can be smoothly separated unit by unit from the stack, thereby avoiding stoppage of the assembling line caused by catching plural units, and enabling production of liquid crystal displays and the like with a good assembling efficiency.

【Solution means】

An optical member in which a surface of an optical material (2), particularly one surface thereof, is bonded to and covered with a protective film (1) having an outer surface roughness Ra of at least 0.03 μm , in accordance with the needs, a separator (4) is provided on the other surface of the optical material via an adhesive layer (3).

【Effect】

The rough surface imparted on the outer surface of the protective film prevents blocking in stacking state.
